

Impact of Areawide Management on *BMSB* Populations (Objective 3)

Yong-Lak Park
West Virginia University

Areawide Management

Why areawide management is needed?

BMSB has wide host range

BMSB is highly mobile

Field-by-field BMSB management has limitation

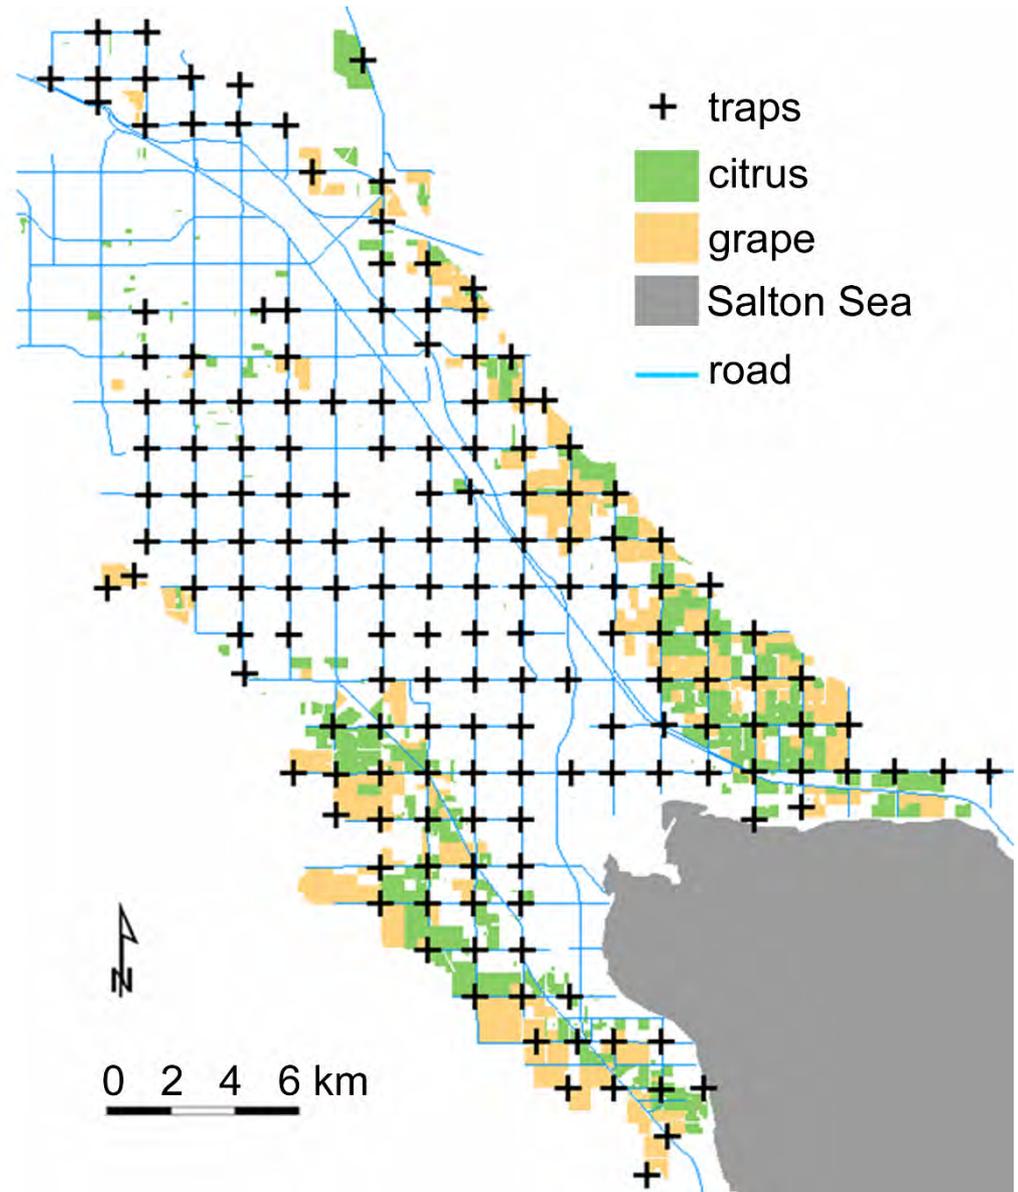

Research question/hypothesis

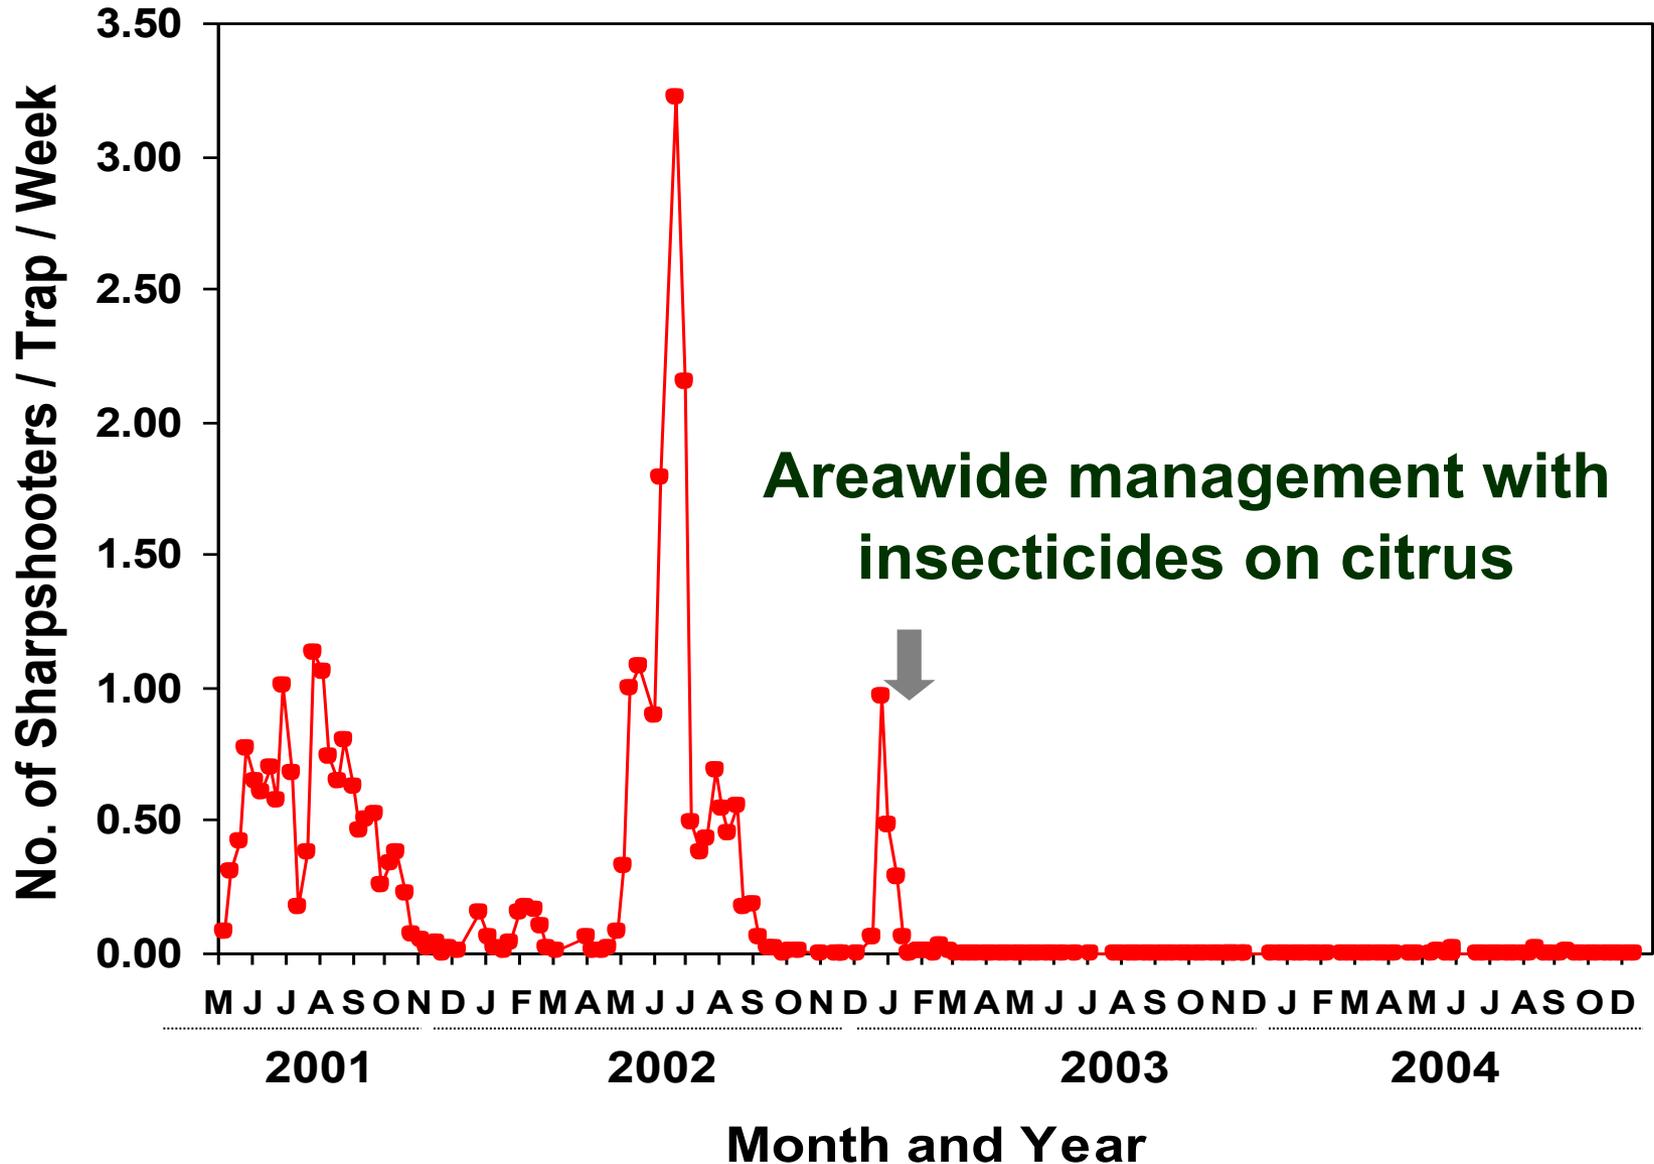

Does areawide management work for BMSB?

Biointensive areawide management

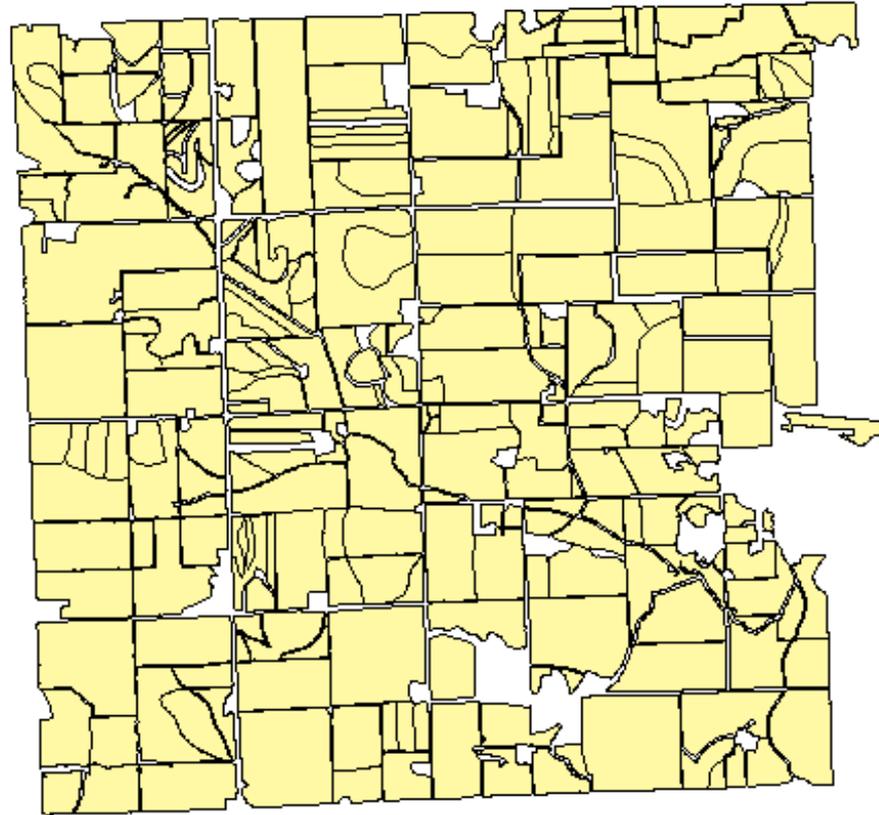

Examples: Glassy-winged Sharpshooter

Examples: Glassy-winged Sharpshooter

Examples: Corn Rootworm

Management site
Semiochemical baits sprayed.

Companion site
Soil insecticide treated.

Field Visits

Discussion on Sample Layout

Discussion: sample layout

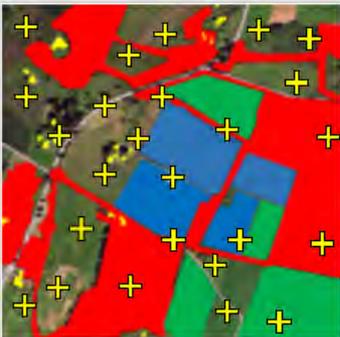

25

Sampling	Estimating BMSB population in each site	Grid or lattice	Transect	Stratified by landscape element	Stratified without considering landscape element	Completely random
		-Samples cover an entire site -Less biased by the location of landscape elements	-When transects are placed along the interface, placing and visiting traps could be easy	-All landscape elements will contain traps	-Provides unbiased estimation of BMSB population in a site	-Provides unbiased estimation of BMSB population in a site
		-Could be not efficient at all to visit all traps in each site -Some landscape elements may not be sampled (excluded) based on where they are located -Placing transects along the interface could hinder farm vehicle movements and management -When transects is placed toward a landscape element, accessing to traps could be difficult -May not provide good population estimate in a site (over or underestimate population)		-Depending on the size of each landscape element, over or underestimation of BMSB population may occur -Locating traps in each element can be difficult, depending on its location, shape, and size -Depending on where random sample points are located within each landscape element, sampling could be difficult		-Depending on where random sample points are located, access to traps could be very difficult -Samples may not cover all landscape elements, specifically for small ones

26

Sampling	Estimating BMSB populations in each landscape element in each site	Overall	Random sampling within each landscape element	Systematic (grid, lattice, stratified, transect, etc.) within each landscape element
		We can compare landscape-element based BMSB populations between management and companion sites Less biased BMSB population estimate can be obtained within each landscape element	This would be a little bit easier for placing and visiting traps than random layout within each landscape element above	Assigning the number of samples to each landscape element can be an issue due to various shape, size, and location of the elements When a landscape element is large, access to traps could be an issue When a landscape element is not large enough or elements are highly fragmented, systematic sample layout may not be work

27

Random

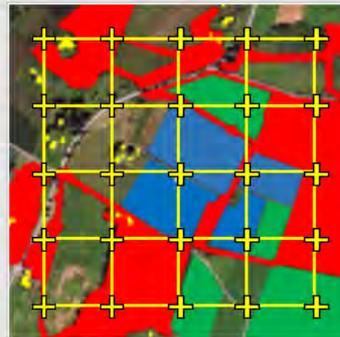

Pros

- Samples cover an entire site
- Less biased by the location of landscape elements

Cons including logistical issues

- Could be not efficient at all to visit all traps in each site
- Some landscape elements may not be sampled (excluded) based on where they are located

28

Lattice

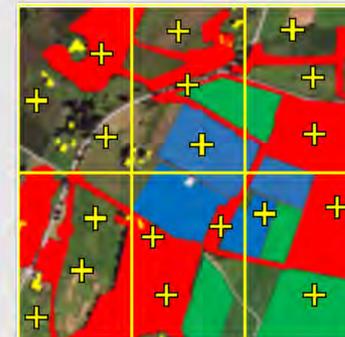

Pros

- Samples cover an entire site
- Less biased by the location of landscape elements

Cons including logistical issues

- Could be not efficient at all to visit all traps in each site
- Some landscape elements may not be sampled (excluded) based on where they are located

29

Stratified by area

Pros

- All landscape elements will contain traps

Cons including logistical issues

- Depending on the size of each landscape element, over or underestimation of BMSB population may occur
- Locating traps in each element can be difficult depending on its location, shape, and size

30

Stratified by landscape element

Pros

- Provide unbiased estimation of BMSB population in a site

Cons including logistical issues

- Depending on where random sample points are located within each landscape element,

Grid

Pros

- Samples cover an entire site
- Less biased by the location of landscape elements

Cons including logistical issues

- Could be not efficient at all to visit all traps in each site

Transect

Pros

- When transects are placed along the interface, placing and visiting traps could be easy

Cons including logistical issues

- Placing transects along the interface could hinder farm vehicle movement and management
- When transect is placed toward a landscape element, accessing to traps

BMSB Sampling Protocol

○ trap

Fig. 1

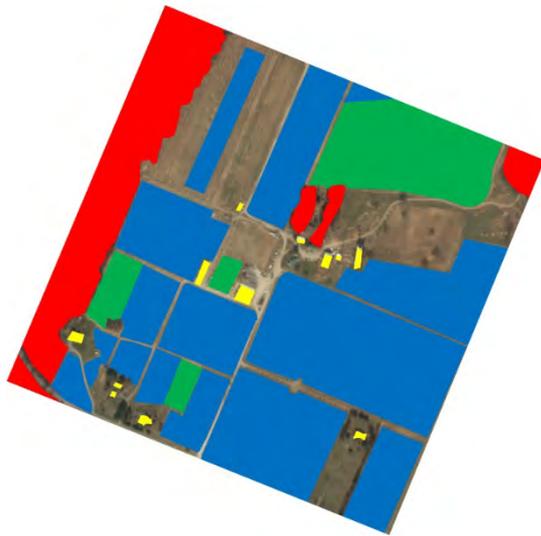

Trapping

- 27 traps per site
- at least 50 m apart
- May to October
- 14-day interval
