UNIVERSITY OF
MARYLAND

Virginia Tech

1.4 - Identify landscape and temporal risk factors associated with BMSB on crops and in adjacent ecosystems

- **Outcomes**
 - Determine why and when BMSB leave one host plant for another
 - Determine where BSMB go when they leave
 - Predict BMSB seasonality and risks to other crops
- **Methods**
 - Monitor movement in and out of fields related to surrounding landscape
 - Monitor movement within fields
 - Techniques – black lights, visual counts, beating, traps, mark-recapture, homeowner reports
 - Map using GIS and geostatistics

The Players

- Rutgers
 - George Hamilton
 - Dean Polk
- University of Maryland
 - Brian Butler
 - Galen Dively
 - Holly Martinson
 - Michael Raupp
 - Paula Shrewsbury
- Oregon State
 - Peter Shearer
 - Silvia Rondon
 - Vaughn Walton
- Penn State University
 - Shelby Fleischer
 - John Tooker
- Virginia Tech
 - Doug Pfeiffer

Progress in 2012

- Presence of BMSB in NJ peach orchards affected by surrounding landscape – woods
- Presence of BMSB in MD nurseries affected by surrounding landscape – soybeans
- General Public Surveys – NJ, PA and Southern IPM Center

BMSB Spatial Patterns in Peaches

Noel Hahn & George Hamilton

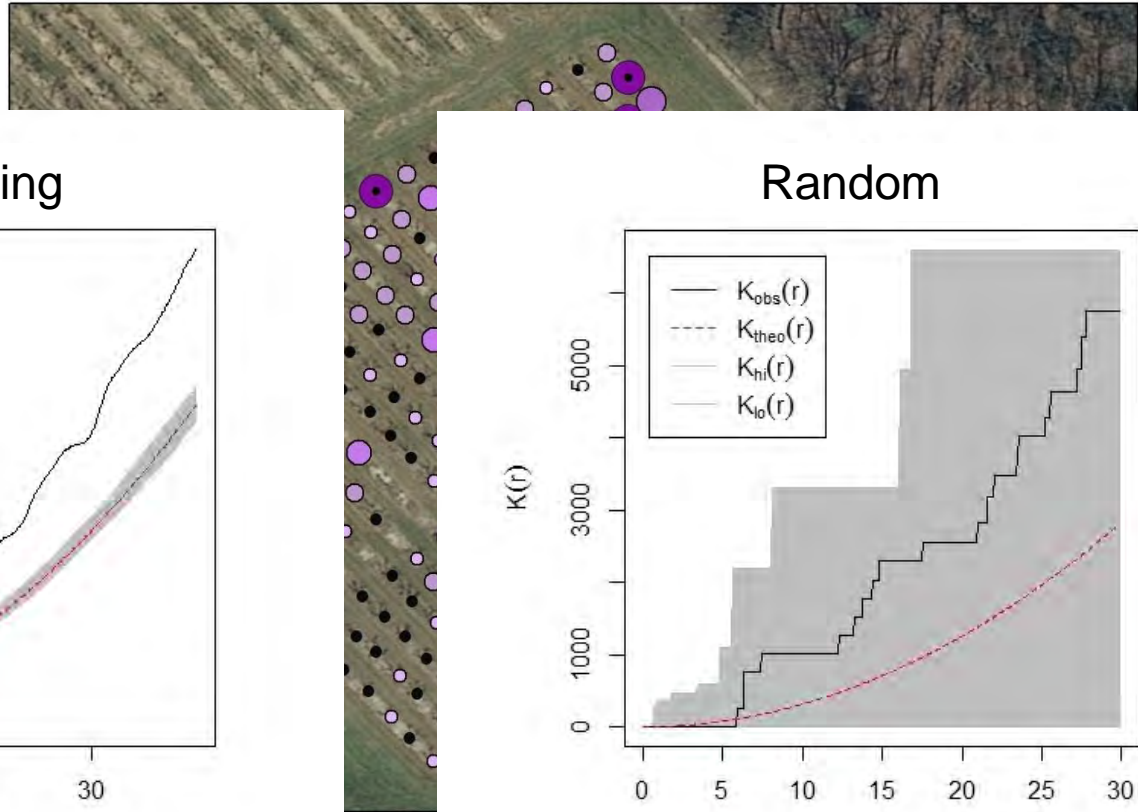

Rutgers University

What spatial patterns do BMSB populations exhibit?

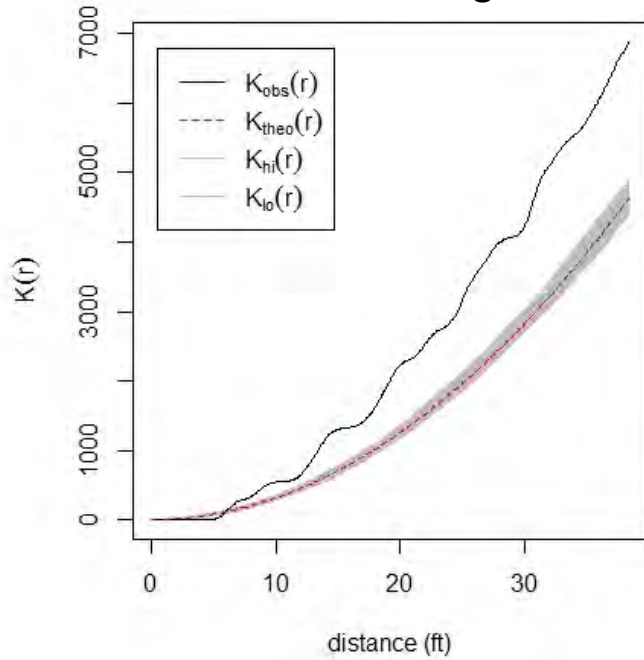

Analysis

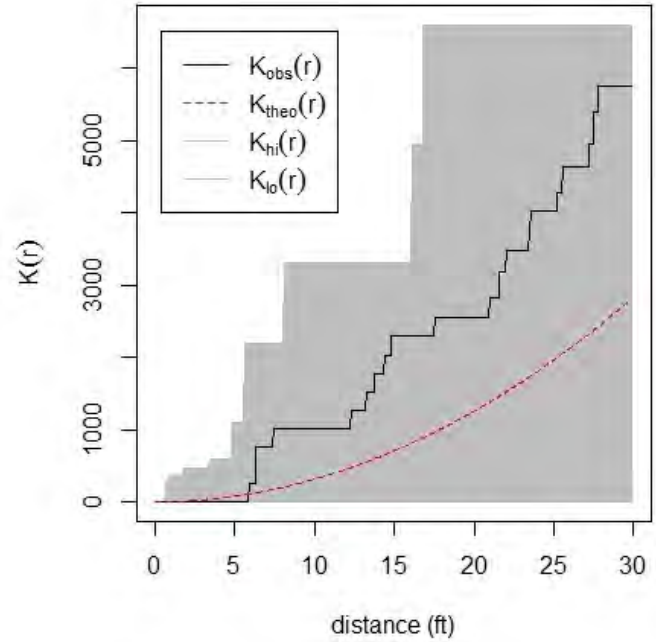

Ripley's K

Clustering

Random

RAREC

- 2-5
- 6-10
- 11-20
- >20

Clustering found

What Can We Conclude

- That populations in this orchard appeared to be clustered throughout the season
- That the clustering in this orchard appears to be related to the adjacent woodlot

BMSB Movement Between Soybeans and Wooded Areas

Kevin Rice & John Tooker
Penn State University

Fluorescent Stink Bugs

- Collected 3,000 BMSB from soybeans
- Half marked yellow, half marked green fluorescent sharpies
- Released and then followed at night for 4 weeks

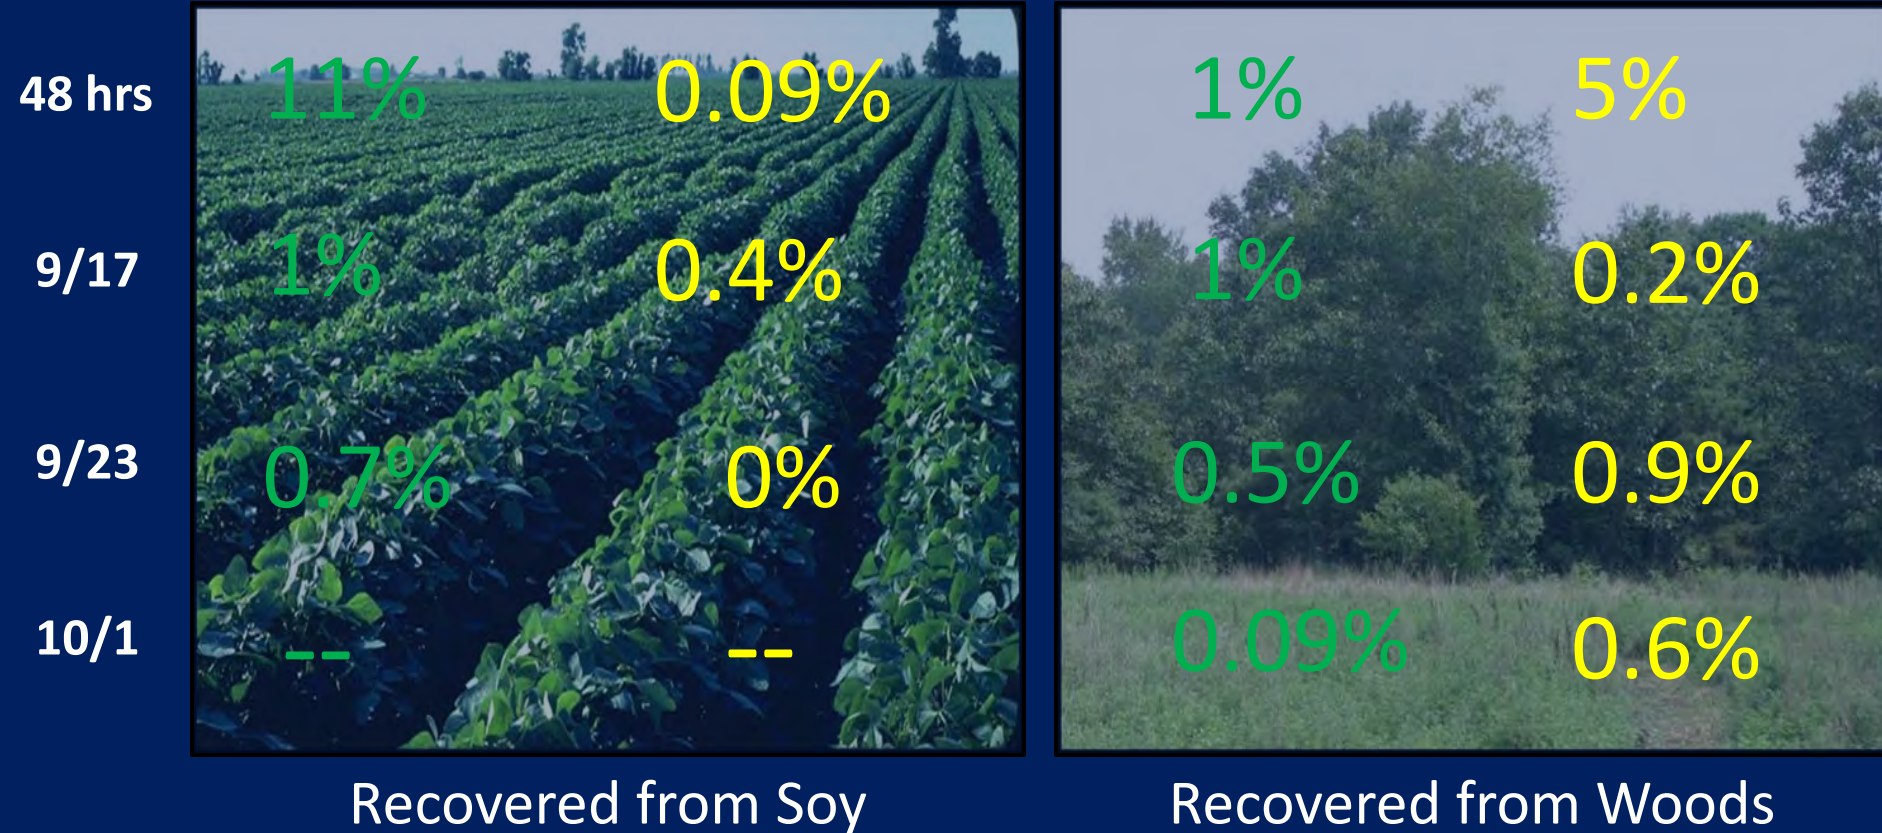

Nick Sloth

Successful Recapture

3 Consecutive Weeks

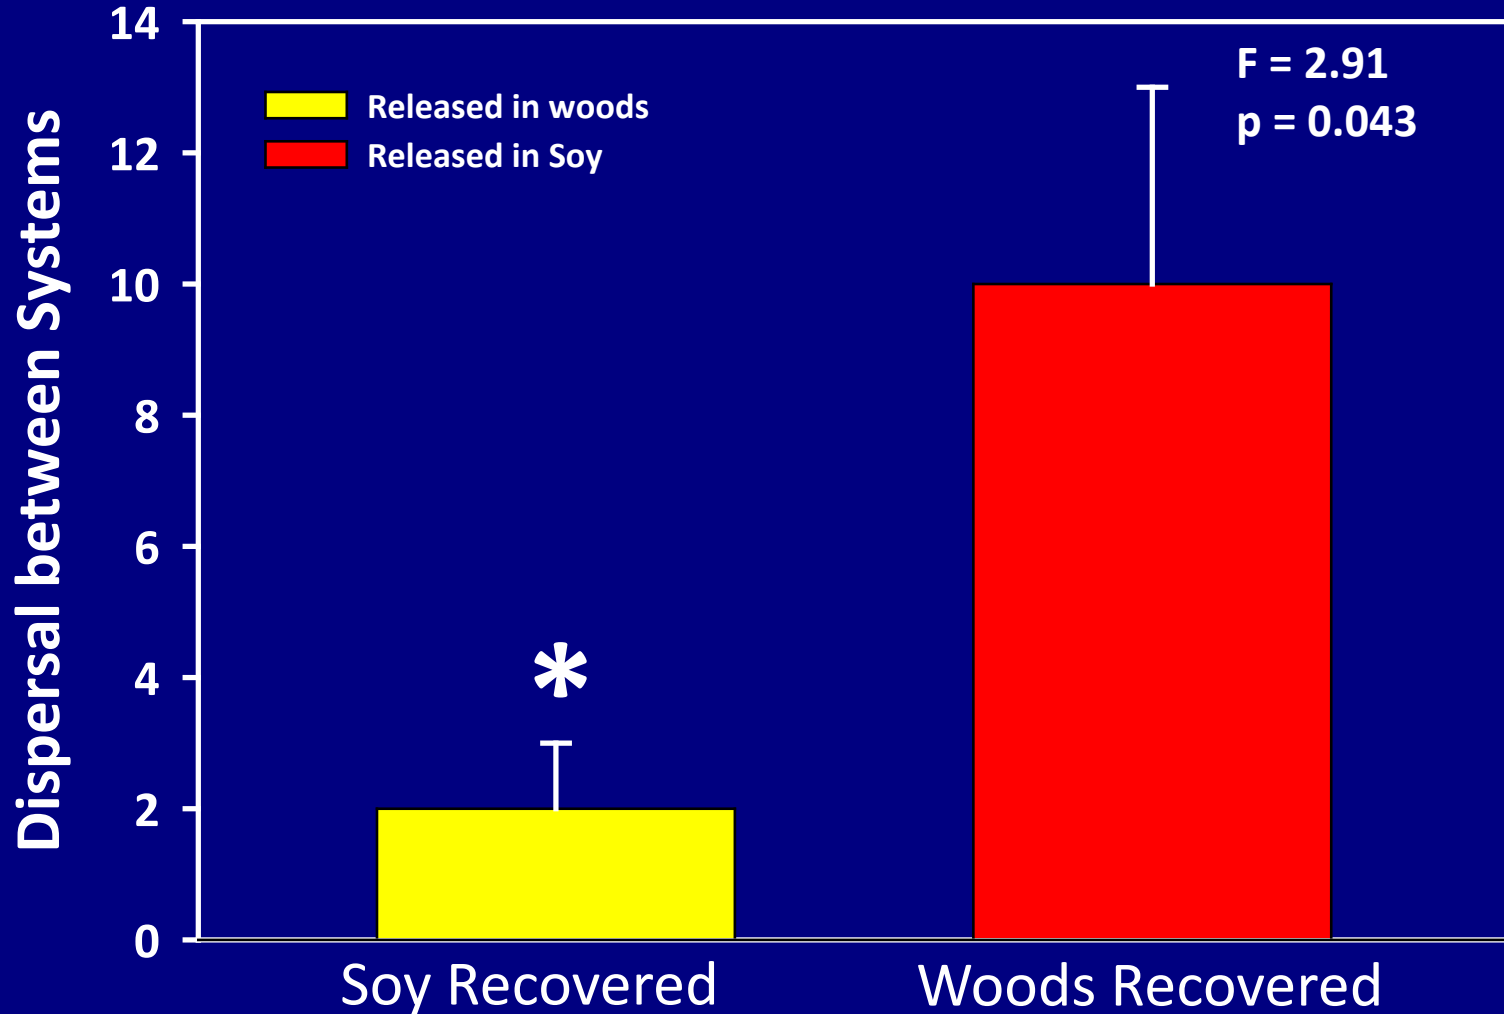

Released in Soy
Released in Woods

Dispersal Distance

Higher Dispersal from Soy to Woods

Conclusions

- Movement between soybeans and wooded areas does occur but decreases through time
- Significant differences were seen in terms of the distance moved by BMSB depending where they were released
- Significantly more BMSB dispersed from soybeans into wooded areas

Determining Sampling Method and BMSB Populations in Relation to Wooded Borders

Dean Polk

Rutgers Cooperative Extension

Determining Sampling Method and BMSB Populations in Relation to Wooded Borders

- Transects established in 7 apple orchards and 9 peach orchards
 - Each sampled block done with paired transects
 - Transect with a trap at the first tree by the woods (TT)
 - Transect with no trap (BT)
 - Sampling points placed ~120 feet starting at border.
- Traps: Single ground mounted black pyramid, baited with ARS#20 + ChemTica MDT.
- Data: BMSB/trap, BMSB/3min count at each sampling point, % injured fruit at harvest.
- Following is an example from 3 apple orchards in southern NJ.

BMSB Trap Count Totals 7/12-9/13 Apple SJ

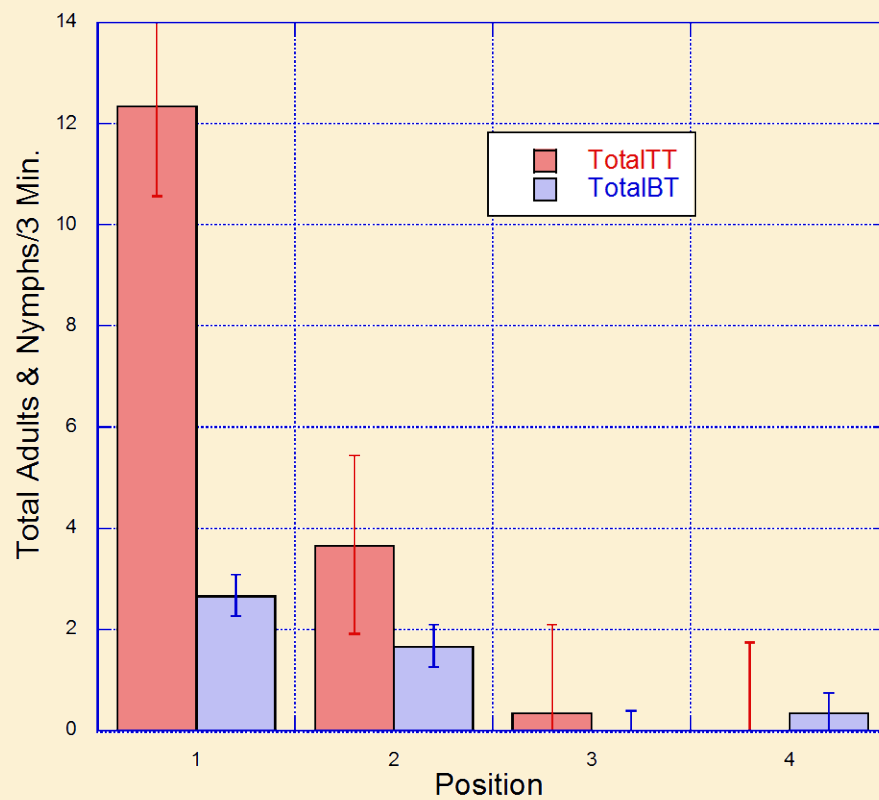

Total BMSB per 3 Min. Ct. - Apples SJ

n=3 Transects Averaged

Total BMSB per 3 Min. Ct. Apples SJ

BMSB Apple Injury by Position & Transect South Jersey 2013

Conclusions

- That the traps baited with ARS#20 + ChemTica MDT caught mostly nymphs
- That more BMSB were found at the edges of the field
- That more BMSB were found at orchard borders in tracts containing a trap with decreased amounts in the orchard interior
- That more damage occurred at the border in transects with traps and decreased in the orchard interior
